## Abrocitinib

**We recommend** abrocitinib in AE patients, who are candidates for systemic treatment.

abrocitinib: in licence for adults;  
dosage adults: 200 mg per day, reduction to 100 mg per day possible, depending on treatment response  
dosage adults age ≥ 65: 100 mg per day

### Certainty of evidence[^1][^2]:
- Short term (8-16 weeks) vs placebo (NMA medications used in clinical practice or likely to be approved soon)
- @@@@@ HIGH for mean difference/ standardized mean difference
- @@@ LOW - @@@ VERY LOW for undesirable effects

The EMA Committee for Medicinal Products for Human Use adopted a positive opinion on 14th October 2021 for adults. In the UK, abrocitinib is currently licensed for AE in those aged 12 and above.

### Mechanisms of action and efficacy

Abrocitinib is an oral JAK1 selective inhibitor and has shown efficacy in patients with moderate-to-severe AE when used as a monotherapy (MONO-1 and -2 studies) and in combination with topical therapies in achieving treatment response in comparison to placebo (COMPARE study), as measured using IGA and EASI-75 response. For instance, the proportion of patients with EASI-75 response at week 12 was significantly higher with abrocitinib 100 mg (~40-45%) and abrocitinib 200 mg (~61-63%) compared to placebo (~10-12%) in the MONO studies. In the COMPARE study the proportion of patients with EASI-75 response was significantly higher with abrocitinib 100 mg (~59%) and abrocitinib 200 mg (~70%) compared to placebo (27%).[^3]

Similar efficacy has been demonstrated in the adolescent JADE TEEN trial for both the 100mg and 200mg doses, in combination with topical therapies.[^4]

Importantly, in the COMPARE study (which had dupilumab as a comparator arm) higher responder rates were observed with abrocitinib 200 mg compared to dupilumab (p-values not calculated) after 16 weeks of treatment. The efficacy of abrocitinib 100 mg and dupilumab was similar in this subgroup. The results indicate that abrocitinib 200 mg may provide a higher probability of treatment response compared to dupilumab in patients with severe AE.[^5]

### Dosage: acute flare, short term, long term

Abrocitinib is licenced at the 100mg and the 200mg daily doses, with the lower dose recommended for adolescents as a starting dose. One study assessed risk and probability of flares and recapture of treatment response following a flare. Of 1233 patients, 798 responders to induction with abrocitinib 200 mg (64.7%) were randomly assigned to dose maintenance, dose reduction or treatment withdrawal (placebo). The flare probability during maintenance was 18.9%, 42.6%, and 80.9% with...
abrocitinib 200 mg, abrocitinib 100 mg, and placebo, respectively by week 52. Among patients with flare in the abrocitinib 200 mg, abrocitinib 100 mg, and placebo groups, 36.6%, 58.8%, and 81.6% regained IGA 0/1 response, respectively, and 55.0%, 74.5%, and 91.8% regained EASI index response, respectively, with rescue treatment of abrocitinib 200 mg plus medicated topical therapy.

Safety

Based on long-term follow up of patients from the phase II and III trials as well as one long-term extension study, with a total n of 2856 (1614 patient-years (PY); total exposure in the all-abrocitinib cohort was ≥ 24 weeks in 1248 patients and ≥ 48 weeks in 606 (maximum 108 weeks). In the placebo-controlled cohort (n = 1540), dose-related adverse events (200 mg, 100 mg, placebo) were nausea (14.6%, 6.1%, 2.0%), headache (7.8%, 5.9%, 3.5%), and acne (4.7%, 1.6%, 0%). Platelet count was reduced transiently in a dose-dependent manner; 2/2718 patients (200-mg group) had confirmed platelet counts of < 50 × 10^3/mm^3 at week 4. Incidence rates (IRs) were 2.33/100PY and 2.65/100 PY for serious infection, 4.34/100PY and 2.04/100PY for herpes zoster, and 11.83/100PY and 8.73/100PY for herpes simplex in the 200-mg and 100-mg groups, respectively.

Monitoring

For baseline screening, the manufacturer’s UK label laboratory monitoring recommendations are full blood count including platelet count, absolute lymphocyte count (ALC), absolute neutrophil count (ANC), and haemoglobin (Hb) as well as lipid parameters. A chest radiograph, creatinine phosphokinase level and an infection screening for HIV, hepatitis B and C as well as TB is advisable before initiation of therapy.

In practice, we recommend the same baseline screening and treatment monitoring investigations for all JAK inhibitors. For baseline screening this is a full blood count, renal, liver and lipid profile as well as creatinine phosphokinase levels and hepatitis and TB screen, including a chest radiograph.

For monitoring purposes, we recommend a full blood count, renal, liver and lipid profile as well as creatinine phosphokinase level at four weeks into treatment and then three-monthly while on therapy.

Combination with other treatments

No studies assessing the use of abrocitinib with other systemic therapiies have been published to date.

Special considerations

Abrocitinib is a new JAK inhibitor and has not been formally tested in other inflammatory diseases.
