Key question 1a: Isotretinoin vs. antibiotics: Efficacy2

Key question 1b: Safety of long term antibiotic use14

Key question 2: Hormonal treatments29

Key question 3: New topical treatments44

Key question 1a: Isotretinoin vs. antibiotics: Efficacy

Research question

For patients with moderate to severe acne, which therapeutic option, isotretinoin or oral antibiotics, should be preferred in terms of effectiveness, quality of life, and (long-term) safety?

Evidence tables

Extraction at the level of systematic reviews

Key question 1b: Safety of long term antibiotic use

Research question

What safety signals have been observed with long-term use of azithromycin, erythromycin, tetracycline, doxycycline, minocycline, lymecycline and sarecycline?

PICO-Question and screening criteria

	Inclusion	Exclusion
Population	Male and female patients with any disease	
Intervention vs. Comparison	Long term use* of antibiotics • Erythromycin • Tetracycline • Doxycycline • Minocycline • Lymecycline • Azithromycin • Sarecycline * long term defined as > 12 weeks	Other antibiotics
Outcome	Safety, as reported Resistance Effects on microbiome	
Study design	Systematic reviews	
Time frame	Stepwise and retroactive (until 2021)	

Evidence tables

Extraction at the level of systematic reviews

Janjua S., et al. Prophylactic antibiotics for adults with chronic obstructive pulmonary disease: a network meta-analysis. Cochrane Database of Systematic Reviews. 2021.1:CD013198. https://pubmed.ncbi.nlm.nih.gov/33448349	SEARCH: Cochrane Airways Group Specialised Register of trials and clinical trials registries. on 22 January 2020. Type of study: RCTs of ≥ 12 weeks duration Intervention: antibiotics prophylactically compared with other antibiotics, or placebo, Population: COPD Outcomes: efficacy, all cause SAE, Drug resistance/Microbial sensitivity, Mortality AMSTAR-II: high quality	Serious adverse events - 9 studies included (n= 3180) in the NMA. - Macrolides reduced odds of SAE compared with placebo (fixed effect-fixed class effect: OR 0.76, 95% CrI 0.62 to 0.93). - probably little to no difference in effect of tetracycline + macrolide compared with placebo. - macrolide treatment: 49 fewer people/1000 experienced SAE compared with placebo. Information on resistance: - only extracted for studies with a treatment duration > 12 wks Doxycycline: - Brill 2015 (n= 99 randomised): change in MIC of 3.74 (95% CI 1.46 to 16.19) with doxycycline (100 mg once daily) compared with placebo at 13 weeks. - isolates from participants taking doxycycline: more likely to be resistant to doxycycline than from those taking placebo (OR 5.77, 95% CI 1.40 to 23.74; P = 0.02). Erythromycin:																																																																		

Reference	Characteristics	Results	Comment
		- He 2010 (n= 36 randomised): no significant group differences (erythromycin 250 mg, 3 times a day vs. placebo, 26 wks) in the emergence of antibiotic resistant organisms. - Seemungal 2008 (n= 109 randomised): 1 participant had colonisation of <i>S. pneumoniae</i> resistant to erythromycin in the erythromycin (250 mg twice daily, 52 wks) treatment arm. All <i>Haemophilus influenzae</i> isolates (22/109) were found to be resistant to erythromycin. Azithromycin: - Albert 2011: already reported in Shim et al. - Uzun 2014: (n= 92 randomised): fewer people had resistant bacteria when taking azithromycin (500 mg, 3x/week, 52 wks) compared with placebo (3 vs. 11; P = 0.036). - Vermeersch 2019 (n= 301 randomised): no significant group differences between azithromycin (500 mg 1x/d for 3 days, followed by 250 mg every 2 days, 13 wks) and placebo for acquired macrolide-resistant bacteria. 1 participant in placebo group had newly acquired macrolide-resistant bacteria. - Blasi 2010 (n= 22 randomised): 1 participant in the azithromycin group (500 mg daily, 3 times a week, 26 wks.) had erythromycin-resistant <i>S. pneumoniae</i>. - Brill 2015 (n= 99 randomised), (azithromycin 250 mg, 3 times a week, 13 wks): most common organisms in sputum were <i>S. pneumoniae</i> and <i>Streptococcus</i> species. Antibiotic resistance was increased, with a factor increase of mean inhibitory concentration of 6.23 (95% CI 1.66 to 23.35; P = 0.01) compared with placebo for sputum isolated cultures	
Mavranzeouli I., et al. A systematic review and network meta-analysis of topical pharmacological, oral pharmacological, physical and combined treatments for acne vulgaris. British Journal of Dermatology. 2022.187(5):639-649. https://pubmed.ncbi.nlm.nih.gov/35789996	OBJECTIVES: identify best treatments for mild-to-moderate and moderate-to-severe acne [SR on NICE Guideline] Search: up to May 2020 Type of study: RCTs Interventions: - topical pharmacological, - oral pharmacological, - physical and combined treatments for mild-to-moderate and moderate-to-severe acne, published → duration not reported Comparison: - each other Outcomes: - efficacy [...] - treatment discontinuation for any reason (reflecting acceptability) - treatment discontinuation owing to side-effects (reflecting tolerability). AMSTAR-II: moderate	Outcome of interest: discontinuation due to side-effects: <u>mild-moderate acne:</u> - Tetracycline (oral) vs. Placebo: log OR 0.71 (credible interval -0.43 to 1.86); n= 489 - Macrolide (oral) vs. Placebo: log OR 3.43 (credible interval -0.23 to 9.42); n= 160 <u>Moderate-severe acne:</u> - Tetracycline (oral) vs. Placebo: log OR 0.92 (credible interval -0.30 to 2.41); n= 1307	

Extraction at the level of studies included in systematic reviews

Important note: A systematic search for systematic reviews was conducted to evaluate the safety of long-term antibiotic use (defined as > 12 weeks). However, not all publications addressed this question directly. For instance, some reviews pooled different antibiotics, while others included primary studies investigating applications of ≤ 12 weeks. In such cases, the results of the systematic review were not extracted, but rather those of relevant primary studies that were included in the systematic reviews.

The cells of the table were highlighted in red if resistance or other microbiological outcomes were reported

Key question 2: Hormonal treatments

Research question

What is the effectiveness, quality of life and (long-term) safety of hormonal treatments for (female) patients with acne?

Arowojolu AO, Gallo MF, Lopez LM, Grimes DA. Combined oral contraceptive pills for treatment of acne. Cochrane Database Syst Rev. 2012 Jul 11;[7]:CD004425. https://pubmed.ncbi.nlm.nih.gov/22786490/	AMSTAR-2: low	Objective - to examine whether any Combined oral contraceptive pills (COC) is more effective than other COCs, oral or topical anti-acne medications or placebo in the treatment of facial acne in women Search period 2008-01/2012 as an update of the previous version of the review (2009) [https://pubmed.ncbi.nlm.nih.gov/19588355/] Databases - Medline, CENTRAL, POPLINE, LILACS, ClinicalTrials.gov, ICTRP Population - Women of any age with facial acne vulgaris Intervention - Any COC (estrogen and progestin) with or without concomitant acne treatment Control - COC, oral or topical acne treatment, - no treatment or placebo	Relevant inclusion criteria / Relevant exclusion criteria / Types of studies Randomized controlled trials Outcomes Effectiveness of drug treatment using at least one of the following outcomes: - Change in specific types of facial lesion [i.e., open or closed comedones, papules, pustules or nodules] counts from baseline to last available evaluation or the specific facial lesion counts at the last available evaluation; - Change in total facial lesion counts from baseline to last available evaluation or the total facial lesion counts at the last available evaluation; - Global assessments made by the clinician or the participant regarding improvement in skin condition [e.g. excellent, good or fair progress versus no change or worse]; - Psychosocial function outcomes, such as quality of life and disability indices, and utility outcome [e.g. willingness to pay or accept treatment]; and - Early study discontinuation due to adverse events, including worsening of acne.	
		Results		
		Baseline characteristics 31 RCTs, 5 secondary articles - Total of 12,579 participants		

Extraction at the level of systematic reviews

- EE doses ranged from 20 µg to 50 µg; one trial used 17β-estradiol (E2) 1.5mg.
 - trials included 11 types of progestin.
 - Duration: 3 to 13 treatment cycles (mode=6 cycles)
 - 24 comparisons:
 - COC to placebo: n= 6,
 - different COC groups: n= 17
 - COC to an antibiotic: n= 1
 - support from pharmaceutical companies: n= 27
 - Risk of bias regarding allocation concealment: low risk (n = 5), unclear risk (n = 25), high risk (n = 1)
- Comparisons**
- **COC versus placebo: 9 trials showed improvements regarding efficacy outcomes, one did not provide sufficient data for analysis**
 - Levonorgestrel (LNG) 100 µg / EE 20 µg vs. placebo:
 - Mean change in total lesion count: MD -9.98 [CI -16.51, -3.45], I²= 0%, 2 studies, n= 572
 - Mean change in inflammatory lesion count: MD -2.95[-4.97, -0.93], I²= 0%, 2 studies, n= 572
 - Mean change in non-inflammatory lesion count: MD -6.75 [-12.56, -0.94], I²= 0%, 2 studies, n= 572
 - Clinician assessment of women with clear or almost clear lesions at cycle 6: Peto OR 1.56 [1.13, 2.18], I²= 0%, 2 studies, n= 571
 - Participant self-assessment of acne lesion improvement: Peto OR 2.13 [1.47, 3.09], I²= 0%, 2 studies, n= 572
 - Discontinuation due to non-acne AEs: treatment (9/174) vs control (6/176); Peto OR 1.54 [0.55, 4.31], 1 study, n= 350
 - Discontinuation due to lack of acne improvement: treatment (7/174) vs control (8/176); Peto OR 0.88 [0.31, 2.47], 1 study, n= 350
 - Norethindrone acetate (NA) 1 mg / EE 20-30-35 µg vs. placebo:
 - Clinician assessment of no, minimal or mild acne at cycle 6: Peto OR 1.86 [1.32, 2.62], 1 study, n= 555
 - Discontinuation due to any AE: treatment (20/297) vs. control (7/296) Peto OR 2.73 [1.26, 5.90], 1 study, n= 593
 - Norgestimate (NGM) 180-215-250 µg / EE 35 µg vs. placebo:
 - Mean change in total lesion count at cycle 6: MD -9.32 [-14.19, -4.45], I²= 77.43%, 2 studies, n= 387
 - Mean change in inflammatory lesion count at cycle 6: -3.44 [-5.43, -1.44], I²= 0%, 2 studies, n= 387
 - Mean change in comedone count at cycle 6: -5.81 [-9.77, -1.85], I²= 79.36%, 2 studies, n= 387
 - Clinician global assessment of improved acne at cycle 6: Peto OR 3.86 [2.31, 6.44], I²= 36.67%, 2 studies, n= 324
 - Participant self-assessment of improved acne at cycle 6: Peto OR 4.5 [2.37, 8.56], 1 study, n= 163
 - Discontinuation due to non-acne adverse event: treatment (18/246) vs. control (9/242), Peto OR 1.98 [0.91, 4.3], I²= 0%, 2 studies, n= 488
 - Discontinuation due to worsening of acne: treatment (5/246) vs. control (1/242), Peto OR 3.75 [0.75, 18.71], I²= 22.59%, 2 studies, n= 488
 - Dienogest 2 mg plus EE 30 µg vs. placebo:
 - Mean percentage change in inflammatory lesion count after cycle 6: MD -16.1 [-21.74, -10.46], 1 study, n= 768
 - Mean percentage change in total lesion count after cycle 6: MD -15.3 [-19.98, -10.62], 1 study, n= 774
 - Improvement of facial acne [clinical assessment]: Peto OR 3.87 [2.5, 5.99], 1 study, n= 780
 - Discontinuation due to adverse event: treatment (8/525) vs. control (3/264), Peto OR 1.33 [0.38, 4.67], 1 study, n= 789
 - Discontinuation due to reason other than adverse event: treatment (14/525) vs. control (16/264), Peto OR 0.4 [0.18, 0.86], 1 study, n= 789
 - Drospirenone (DRSP) 3 mg / EE 20 µg vs. placebo:
 - Mean percent change in total lesion count at cycle 6: MD 29.08 [3.13, 55.03], 1 study, n= 173
 - Mean percent change in inflammatory lesion count at cycle 6: MD 14.61 [5.18, 24.04], 1 study, n= 146
 - Mean percent change in non-inflammatory lesion count at cycle 6: MD 19.03 [5.13, 32.93], 1 study, n= 146
 - Mean percent change in papule count at cycle 6: MD 17.33 [5.6, 29.06], 1 study, n= 146
 - Mean percent change in pustule count at cycle 6: MD 1.73 [-11.48, 14.94], 1 study, n= 125*
 - Mean percent change in nodule count at cycle 6: MD 0.83 [-8.8, 10.46], 1 study, n= 62*
 - Mean percent change in open comedone count at cycle 6: MD -14.28 [-84.76, 56.2], 1 study, n= 141*

Extraction at the level of systematic reviews

- * CAVE: Contrary to the headline, these three endpoints do not present statistically significant results
- Mean percent change in closed comedone count at cycle 6: MD 20.79 [3.57, 38.01], 1 study, n= 145
 - Clear or almost clear [investigator assessment] at cycle 6: Peto OR 3.02 [1.99, 4.59], I²= 0%, 2 studies, n= 575
 - Participants classified as 'improved' at cycle 6 [Investigator assessment]: Peto OR 3.67 [1.46, 9.2], 1 study, n= 152
 - Participants classified as 'improved' at cycle 6 [Participant assessment]: Peto OR 3.06 [1.06, 8.85], 1 study, n= 152
 - Discontinuation due to adverse event: treatment (37/625) vs. control (24/626), Peto OR 1.57 [0.94, 2.62], I²= 0%, 3 studies, n = 1251
 - Discontinuation due reason other than adverse event: treatment (9/89) vs. control (11/90), Peto OR 0.71[0.28, 1.84], 1 study, n= 179
 - Chlormadinone acetate (CMA) 2 mg / EE 30 µg vs. placebo:
 - Responders [≥50% decrease in facial papules and pustules] at cycle 6.: Peto OR 2.31 [1.5, 3.55], 1 study, n= 377
 - Discontinuation due to AEs: treatment (14/251) vs. control (1/126), Peto OR 3.49 [1.17, 10.4], 1 study, n= 377
 - **Drospirenone (DRSP) 3 mg/EE 30 µg versus other COCs:**
 - DRSP 3 mg / EE 30 µg vs. CPA 2 mg / EE 35 µg:
 - Mean percentage change in total acne count at cycle 9: MD -2.5 [-26.96, 21.96], 1 study, n= 118
 - DRSP 3 mg / EE 30 µg vs. LNG 150 µg / EE 30 µg:
 - Discontinuation due to acne deterioration: treatment (4/282) vs. control (11/142), Peto OR 0.16 [0.05, 0.47], 1 study, n= 424
 - DRSP 3 mg / EE 30 µg versus NGM 180-215-250 µg / EE 35 µg:
 - Mean percentage change in ILC after cycle 6: MD -2.4 [-5.97, 1.17], 1 study, n= 1108
 - Mean percentage change in TLC after cycle 6: MD -3.3 [-6.45, -0.15], 1 study, n= 1108, favours treatment
 - Improvement of facial acne [clinical assessment]: treatment (527/551) vs. control (524/569), Peto OR 1.85 [1.14, 3.01], 1 study, n= 1120
 - Improvement of facial acne [subject assessment]: treatment (512/550) vs. control (505/567), Peto OR 1.64 [1.09, 2.47], 1 study, n= 1117
 - Discontinuation due to AE: treatment (18/566) vs. control (23/582), Peto OR 0.8 [0.43, 1.49], 1 study, n= 1148
 - Discontinuation due to reason other than AE: treatment (17/566) vs. control (18/582), Peto OR 0.97 [0.5, 1.9], 1 study, n= 1148
 - NOMAC 2 mg / E2 1.5 mg versus DRSP 3 mg / EE 30 µg:
 - Clinician assessment of improved acne after cycle 13 [participants with acne at baseline]: treatment (248/512) vs. control (105/171), Peto OR 0.6 [0.42, 0.84], 1 study, n= 683
 - Clinician assessment of worsening acne after cycle 13 [all participants]: treatment (154/1561) vs. control (21/522), Peto OR 2.14 [1.49, 3.05], 1 study, n= 2083
 - Discontinuation due to AEs: treatment (290/1591) vs. control (56/535), Peto OR 1.77 [1.36, 2.3], 1 study, n= 2126
 - Discontinuation due to acne: treatment (53/1591) vs. control (1/535), Peto OR 3.56 [1.91, 6.63], 1 study, n= 2126
 - **DSG/EE vs. CPA/EE or DSG/EE:**
 - DSG 25-125 µg / EE 40-30 µg versus CPA 2 mg / EE 35 µg:
 - Photographic evaluation of mean change in acne at cycle 4: MD 0.1 [-0.1, 0.3], 1 study, n= 99
 - Women with pustules or nodules at cycle 4: treatment (33/59) vs. control (31/62), Peto OR 1.27 [0.62, 2.58], 1 study, n= 121
 - Mean change in comedone count at cycle 4 MD: 3.7 [-5.39, 12.79], 1 study, n= 121
 - Mean change in papule count at cycle 4: MD -0.6 [-4.16, 2.96], 1 study, n= 121
 - Mean change in pustule count at cycle 4: MD 2.3 [-0.15, 4.75], 1 study, n= 121
 - Women with moderate acne at cycle 6: treatment (32/68) vs. control (29/68), Peto OR 1.19 [0.61, 2.34], 1 study, n= 136
 - Women with severe acne at cycle 6: treatment (4/68) vs. control (2/68), Peto OR 2 [0.39, 10.21], 1 study, n= 136
 - Mean comedone count at cycle 6: MD 2.9 [0.05, 5.75], 1 study, n= 136, favours control
 - Mean papule count at cycle 6: MD 1.8 [-0.4, 4], 1 study, n= 136
 - Mean pustule count at cycle 6: MD 0.8 [-0.35, 1.95], 1 study, n= 136
 - Mean nodule count at cycle 6: MD 0 [-0.18, 0.18], 1 study, n= 136
 - Discontinuation due to non-acne AE: treatment (6/84) vs. control (4/88), Peto OR 1.6 [0.45, 5.73], 1 study, n= 172
 - Discontinuation due to worsening of acne: treatment (1/84) vs. control (1/88), Peto OR 1.05 [0.06, 16.9], 1 study, n= 172
 - DSG 150 µg / EE 30 µg versus CPA 2 mg / EE 50 µg:
 - Women with moderate or severe acne at cycle 6: treatment (12/26) vs. control (3/31), Peto OR 6.35 [1.96, 20.52], 1 study, n= 57

Extraction at the level of systematic reviews

- Women with self-assessed acne improvement at cycle 6: treatment (25/26) vs. control (28/31), Peto OR: 2.41 [0.32, 18.18], 1 study, n= 57
 - Discontinuation due to side effects: treatment (2/32) vs. control (1/34), Peto OR 2.12 [0.21, 21.13], 1 study, n= 66
 - DSG 150 µg / EE 30 µg versus GSD 75 µg / EE 30 µg:

 - Women with mild acne at cycle 6: treatment (57/619) vs. control (68/561), Peto OR: 0.76 [0.52, 1.1], I²= 67.61%, 2 studies, n= 1180
 - Women with moderate or severe acne at cycle 6: treatment (13/619) vs. control (7/561), Peto OR: 1.78 [0.73, 4.32], I²= 0%, 2 studies, n= 1180
 - Women with mild or no acne: treatment (10/11) vs. control (5/8), Peto OR 5.05 [0.57, 44.42], 1 study, n= 19
 - Women with improved acne score: treatment (10/11) vs. control (7/8), Peto OR 1.41 [0.08, 25.31], 1 study, n= 19
 - Discontinuation due to side effects: treatment (40/710) vs. control (57/668), Peto OR 0.61 [0.4, 0.93], 1 study, n= 1378
 - DSG 150 µg / EE 20 µg versus LNG 100 µg / EE 20 µg:
 - Improvement in comedones at week 25: treatment (71/266) vs. control (49/258), Peto OR 1.55 [1.03, 2.32], 1 study, n= 524
 - Worsening in comedones at week 25: treatment (27/266) vs. control (32/258), Peto OR 0.8 [0.46, 1.37], 1 study, n= 524
 - Improvement in papules at week 25: treatment (63/266) vs. control (61/258), Peto OR 1 [0.67, 1.5], 1 study, n= 524
 - Worsening in papules at week 25: treatment (31/266) vs. control (47/258), Peto OR 0.6 [0.37, 0.96], 1 study, n= 524
 - Improvement in pustules at week 25: treatment (46/266) vs. control (32/258), Peto OR 1.47 [0.91, 2.38], 1 study, n= 524
 - Worsening in pustules at week 25: treatment (23/266) vs. control (33/258), Peto OR 0.65 [0.37, 1.13], 1 study, n= 524
 - Improvement in nodules at week 25: treatment (14/266) vs. control (17/258), Peto OR 0.79 [0.38, 1.63], 1 study, n= 524
 - Worsening in nodules at week 25: treatment (8/266) vs. control (7/258), Peto OR 1.11 [0.4, 3.1], 1 study, n= 524
 - Scores for Psychological General Well-Being Index at week 13: MD 1.9 [0.26, 3.54], 1 study, n= 720, favours treatment
 - Scores for Psychological General Well-Being Index at week 25: MD 1.1 [-0.83, 3.03], 1 study, n= 720
 - AEs related to treatment: treatment (31/500) vs. control (32/498), Peto OR 0.96 [0.58, 1.6], 1 study, n= 998
 - AEs not related to treatment: treatment (79/500) vs. control (58/498), Peto OR 1.42 [0.99, 2.04], 1 study, n= 998
- **LNG/EE vs. other COCs:**
 - LNG 150 µg / EE 30 µg versus DSG 150 µg / EE 30 µg:
 - Mean acne severity score at cycle 6: MD 0.5 [0.09, 0.91], 1 study, n= 33, favours control
 - Mean total lesion count at cycle 9: MD 6.3 [-9.93, 22.53], 1 study, n= 16
 - Discontinuation due to side effects: treatment (1/17) vs. control (1/17), Peto OR 1.0 [0.06, 16.69], 1 study, n= 34
 - Discontinuation due to worsening acne: treatment (4/28) vs. control (2/26), Peto OR 1.93 [0.36, 10.36], 1 study, n= 54
 - LNG 150 µg / EE 30 µg versus CMA 2 mg / EE 30 µg:
 - Women with >= 50% reduction in pustules and papules at cycle 12: treatment (45/98) vs. control (60/101), Peto OR: 0.58 [0.33, 1.02], 1 study, n= 199
 - Women with Plewig score of 0 at cycle 12: treatment (38/70) vs. control (53/79), Peto OR 0.59 [0.30, 1.13], 1 study, n= 149
 - Women with increased pustules or papules lesion count at cycle 12: treatment (8/70) vs. control (0/79), Peto OR 9.34 [2.25, 38.73], 1 study, n= 149
 - Women with comedones improvement at cycle 12: treatment (51/66) vs. control (64/72), Peto OR 0.44 [0.18, 1.06], 1 study, n= 138
 - Women with self-assessed acne improvement at cycle 12: treatment (61/70) vs. control (78/79), Peto OR: 0.16 [0.04, 0.57], 1 study, n= 149
 - LNG 150 µg / EE 30 µg versus CPA 2 mg / EE 35 µg:
 - Mean change in total acne lesions at cycle 6: MD: 2.5 [-8.81, 13.81], 1 study, n= 80
 - Mean pustule count at cycle 6: MD: 1.8 [0.63, 2.97], 1 study, n= 80, favours control
 - Mean papule count at cycle 6: MD: 2.9 [0.2, 5.6], 1 study, n= 80, favours control
 - Mean cyst and nodule count at cycle 6: MD: 0.4 [-0.13, 0.93], 1 study, n= 80
 - Women with dermatologist global "good" acne assessment at cycle 6: treatment (11/36) vs. control (28/45), Peto OR: 0.29 [0.12, 0.68], 1 study, n= 81
 - Women with "good" acne self-assessment at cycle 6: treatment (11/36) vs. control (30/44), Peto OR: 0.23 [0.09, 0.54], 1 study, n= 80
 - Discontinuation due to side effects: treatment (6/37) vs. control (6/48), Peto OR: 1.35 [0.4, 4.6], 1 study, n= 85
 - LNG 150 µg / EE 30 µg versus CPA 2 mg / EE 50 µg:
 - Mean change in total acne lesions at cycle 6: MD: 0.1 [-10.79, 10.99], 1 study, n= 81

Extraction at the level of systematic reviews

		- Chemical peels: alpha hydroxy acid [glycolic acid, lactic acid, mandelic acid] and beta hydroxy acid [salicylic acid] - Comedo extraction - Lasers - Photodynamic/Light therapies: blue light therapy, red light therapy, ALA, and IPL - Any combination therapy of the above - Control / Placebo / No treatment		
Results				
Baseline characteristics 27 RCTs included 8 comparisons: - COC to placebo (data for all COCs were pooled): n= 1 - different COC groups: n= 6 - spironolactone to placebo: n= 1 Comparisons Any COC versus placebo: - Physician global assessment, clear or almost clear after cycle 6: 191/499 (38.3%) vs. 138/504 (27.4%); RR 1.45 [1.06, 1.97], 3 RCTs, I²= 65% - Physician global assessment, no, minimal or mild facial acne after cycle 6: 124/280 (44.3%) vs. 82/275 (29.8%) RR 1.49 [1.19, 1.86], 1 RCT - Physician global assessment, improvement after cycle 6: 621/682 (91.1%) vs. 302/422 (71.6%) RR 1.29 [1.15, 1.44], 3 RCTs, I²= 49% - Physician global assessment, VAS score, after cycle 6: Changes from baseline for both treatment groups revealed significant increases in investigator VAS scores, which were increasingly larger in the DSGOC group over time. Significant differences at endpoint of about 11 mm [p = 0.04] showed a beneficial treatment effect for DSG-OC. *Used a 100-mm visual analog scale [VAS], with higher scores reflecting a better skin appearance*, 1 RCT - Total lesion, change from baseline after cycle 6: MD -9.69 [-14.58, -4.8], I²= 34%, 4 RCTs, n= 959, favours COC - Total lesion, percentage change from baseline after cycle 6: MD -16.6 [-20.8, -12.4], I²= 8%, 8 RCTs, n= 1506, favours COC - Inflammatory lesion, change from baseline after cycle 6: MD -3.23 [-4.64, -1.81], 4 RCTs, I²= 0%, n= 959, favours COC - Inflammatory lesion, percentage change from baseline after cycle 6: MD -15.81 [-20.44, -11.7], I²= 9%, 9 RCTs, n= 3220, favours COC - Non-inflammatory lesion, change from baseline after cycle 6: MD -6.37 [-10.87, -1.88], I²= 44%, 4 RCTs, n= 959, favours COC - Non-inflammatory lesion, percentage change from baseline after cycle 6: MD -19.45 [-29.9, -9], I²= 0%, 6 RCTs, favours COC - Serious AE: 2/471 (0.4%) vs. 2/472 (0.4%) RR 0.96 [0.14, 6.49], I²= 0%, 2 RCTs - Patient global assessment, improvement after cycle 6: 487/591 (82.4%) vs. 371/587 (63.2%) RR 1.31 [1.17, 1.48], I²= 56%, 4 RCTs - Patient global assessment after cycle 6: no effect estimate calculated, "Changes from baseline for both treatment groups in Katz 2000 revealed significant increases in patient VAS scores [a 100-mm visual analog scale with high scores reflecting a better skin appearance), which were increasingly larger in the DSG-OC group over time. Significant differences at the endpoint of about 14 mm (p = 0.03) showed a beneficial treatment effect for DSG-OC. At the end of cycle 6 in Plewig 2009 study, at least 70.5% of women taking EE/CMA rated the improvement of their moderate acne lesions as completely resolved (2.8%), excellent improved (37.1%) or satisfactory improved (30.7%), whereas 41.3% of women of the placebo group stated the improvement of their moderate acne lesions as at least satisfactory. "No moderate acne improvement" was reported by 11.6% of subjects taking EE/CMA compared with 19.8% of subjects taking placebo, and a "deterioration" was reported by 6% vs. 13.5% of subjects, respectively", 2 RCTs. - Withdrawal due to AE: 104/2034 (5.1%) vs. 48/1643 (2.9%) RR 1.86 [1.32, 2.62], I²= 0%, 8 RCTs - Acne QoL, self-perception after cycle 6: MD 3.45 [1.87, 5.03], 1 RCT, n= 450, favours COC - Acne QoL, role-emotional, after cycle 6: MD 4.03 [2.41, 5.65], 1 RCT, n= 450, favours COC - Acne QoL, role-social, after cycle 6: MD 2.58 [1.42, 3.74], 1 RCT, n= 448, favours COC - Acne QoL, acne symptoms, after cycle 6: MD 2.96 [1.86, 4.06], 1 RCT, n= 446, favours COC - Any AE: 668/1236 (54.0%) vs. 424/847 (50.1%) RR 1.15 [1.07, 1.24], I²= 0%, 4 RCTs - DRSP 3 mg/EE 30 µg vs. LNG 150 µg/ EE 30 µg: 1 RCT				

Extraction at the level of systematic reviews	
	○ Total lesion after cycle 7: no effect estimate calculated, "Mean total lesion count decreased in the DRSP 3mg/EE 30 mg group with ongoing treatment, but remained relatively static in the LNG 150 mg/EE 30 mg group. Consistent with the changes in mean total lesion counts, there was a decrease in the proportion of subjects with acne in the DRSP 3mg/EE 30 mg group, but not in the LNG 150 mg/EE 30 mg group.", 1 RCT ○ Deep vein thrombosis: 1/282 (0.4%) vs. 0/142 (0.0%) RR 1.52 [0.06, 36.98], 1 RCT ○ Serious AE: 2/282 (0.7%) vs. 0/142 (0.0%) RR 2.53 [0.12, 52.28], 1 RCT ○ Any AE: 109/282 (38.7%) vs. 62/142 (43.7%) RR 0.89 [0.70, 1.12], 1 RCT ● LNG 150 µg / EE 30 µg vs. DSG 150 µg / EE 30 µg: 2 RCTs ○ Mean acne severity score after cycle 6: 1.26 ± 0.56 vs. 0.78 ± 0.66; MD 0.48 [0.06, 0.9], 1 RCT, n= 33 ○ Mean total lesion count after cycle 9: 17.6 ± 7.6 vs. 11.3 ± 3.3; MD 6.3 [0.77, 11.83], 1 RCT, n= 16 ○ Total lesion, percentage change from baseline, after cycle 9: no effect estimate calculated, "In subjects completing 9 months of therapy, acne decreased by 52.8% in the LNG/EE group (n = 9) and by 58.5% in the DSG/EE (n = 7) (between groups: P not significant).", 1 RCT ○ Withdrawal due to AE: 4/45 (8.9 %) vs. 3/43 (7.0%); RR 1.27 [0.30, 5.35], 2 RCTs ● DSG 150 µg / EE 20 µg vs. LNG 100 µg / EE 20 µg: 1 RCT ○ Improvement in comedones after cycle 6: 71/266 (26.7%) vs. 49/258 (19.0%) RR 1.41 [1.02, 1.94], 1 RCT ○ Improvement in papules after cycle 6: 63/266 (23.7%) vs. 61/258 (23.6%) RR 1.00 [0.74, 1.36], 1 RCT ○ Improvement in pustules after cycle 6: 46/266 (17.3%) vs. 32/258 (12.4%) RR 1.39 [0.92, 2.12], 1 RCT ○ Improvement in nodules after cycle 6: 14/266 (5.3%) vs. 17/258 (6.6%) RR 0.80 [0.40, 1.59], 1 RCT ○ Withdrawal due to AE: 10/500 (2.0%) vs. 26/498 (5.2%) RR 0.38 [0.19, 0.79], 1 RCT ○ Scores for Psychological General Well-Being Index after cycle 6: MD 1.1 [-0.83, 3.03], 1 RCT, n= 516 ● NGM/EE (triphasic) vs. DSG/EE (biphasic): 1 RCT ○ Physician global assessment, excellent or good, after cycle 6: 81/93 (87.1%) vs. 71/95 (74.7%); RR 1.17 [1.01, 1.34], 1 RCT ○ Total lesion, change from baseline after cycle 6: -13.4 ± 9.7 vs. -11.9 ± 10.1, MD -1.5 [-4.33, 1.33], 1 RCT, n= 188 ○ Total lesion, percentage change from baseline, after cycle 6: -74.4 ± 35.2 vs. -65.1 ± 35.2, MD -9.3 [-19.36, 0.76], 1 RCT, n= 188 ○ Papules, change from baseline after cycle 6: -3.5 ± 5.1 vs. -2.8 ± 4.6, MD -0.7 [-2.09, 0.69], 1 RCT, n= 188 ○ Pustules and Nodules, change from baseline after cycle 6: -0.9 ± 2.3 vs. -1.0 ± 2.1 MD 0.1 [-0.53, 0.73], 1 RCT, n= 188 ○ Comedones, change from baseline after cycle 6: -9.0 ± 6.3 vs. -8.2 ± 7.4 MD -0.8 [-2.76, 1.16], 1 RCT, n= 188 ○ Serious AE: 2/100 (2.0%) vs. 0/101 (0.0%), RR 5.05 [0.25, 103.87], 1 RCT ○ Patient global assessment, excellent or good after cycle 6: 86/93 (92.5%) vs. 91/95 (95.8%) RR 0.97 [0.90, 1.04], 1 RCT ● DRSP 3 mg / EE 30 µg vs. NGM 180-215-250 µg / EE 35 µg: 1 RCT ○ Physician global assessment, Improvement of facial acne after cycle 6: 527/551 (95.6%) vs. 524/569 (92.1%) RR 1.04 [1.01, 1.07], 1 RCT ○ Total lesion, percentage change from baseline after cycle 6: no information reported, MD -3.3 [-6.45, -0.15], 1 RCT, n= 1108 ○ Total lesion, change from baseline after cycle 6: no information reported, MD -2.6 [-5.72, 0.52], 1 RCT, n= 1108 ○ Inflammatory lesion, percentage change from baseline after cycle 6: no information reported, MD -2.4 [-5.97, 1.17], 1 RCT, n= 1108 ○ Inflammatory lesion, change from baseline after cycle 6: no information reported, MD -0.5 [-1.86, 0.86], 1 RCT, n= 1108 ○ Open comedone, percentage change from baseline after cycle 6: no information reported, MD -9.3 [-17.59, -1.01], 1 RCT, n= 1108 ○ Open comedone, change from baseline after cycle 6: no information reported, MD -1.5 [-3.17, 0.17], 1 RCT, n= 1108 ○ Closed comedone, percentage change from baseline after cycle 6: no information reported, MD -5.2 [-13.45, 3.05], 1 RCT ○ Closed comedone, change from baseline after cycle 6: no information reported, MD -0.6 [-2.1, 0.9], 1 RCT ○ Serious AE: 18/566 (3.2%) vs. 2/582 (0.3%) RR 9.25 [2.16, 39.70], 1 RCT ○ Patient global assessment, improvement of facial acne after cycle 6: 512/550 (93.1%) vs. 505/567 (89.1%) RR 1.05 [1.01, 1.08], 1 RCT ○ Discontinuation due to adverse event: 18/566 (3.2%) vs. 23/582 (4.0%) RR 0.80 [0.44, 1.47], 1 RCT ○ Any AE: 92/566 (16.3%) vs. 106/582 (18.2%) RR 0.89 [0.69, 1.15], 1 RCT ● LNG 100 µg / EE 20 µg vs. NA 1 mg / EE 20 µg: 1 RCT ○ Total lesion, change from baseline after cycle 3 [subgroup of women with ≥ 15 lesions at baseline]: -18.4±15.8 vs. -20.9±16.5, MD 2.5 [-12.26, 17.26], 1 RCT, n= 19
